

Title:

Week 1: Introduction and Learning

Agenda:

The Agenda for this week was to become familiar with the technologies and ideas being used in the Project GradeGator. Our main aims were to learn about the organization and structure of the GitHub repository, familiarize ourselves with the system, and become acquainted with key technologies we were unfamiliar with, such as AWS EC2, Lambda, and S3, as well as Typescript and React. Additionally, we aimed to get the app working on our local computers.

Resources:

We utilized online resources, including tutorials provided by Dr. Lim, to learn about EC2 instances. Furthermore, we also looked at YouTube videos from various channels, such as FreeCodeCamp, to learn about Lambda and Typescript. Lastly, through in-person meetings with Dubose and Dr. Lim, we had the opportunity to ask questions and gain a better understanding of the system.

Individual Contributions:**Harsh:**

- I worked on setting up an AWS account and getting familiar with its system. Then, I followed the tutorials mentioned in the repository and launched my first EC2 instance. I also read the final report, especially the system diagram, to gather any questions for our meeting on Thursday with Dubose. Furthermore, I watched YouTube videos on TypeScript, React, and Docker to familiarize myself with the technologies. Further, I worked on getting the app to run locally on my computer but had to put a hold on that until T&I grants us access to the AWS administration account. Lastly, I worked on setting up the template for this report. Furthermore, I am exploring the Lambda function and how to send requests to it, as well as completing the app setup as soon as I gain access to the AWS account.

Brandon:

My work this week centered on learning AWS technologies, becoming familiar with React, and understanding the project's structure. I worked on AWS by signing up for an account and learning EC2, Lambda, and IAM Identity Center. I also worked on all four tutorials + instructions for Week 1 on the GradeGator repository. Then, I read the project reports, focusing particularly on the final report to gain a clear understanding of the project structure. Since I had experience working with the web framework Svelte, learning how React operates was not difficult. However, I still do not know how to work with React, but learning Typescript will help overcome this challenge. I was able to get the React front end to run; however, I was not able to

do the same with the backend, as Harsh and I need permissions granted by the AWS account. We are still waiting to be added by T&I. Therefore, I started working on a basic react application so that it could be hosted on EC2, and that was successful. The next steps are to figure out how to implement changes to the website on EC2 using the repository, gain access to AWS, ensure we can run GradeGator on our personal computers, and utilize the GradeGator frontend and backend instead of the basic React application. I think we can make changes to EC2 by creating a different remote for the website on the EC2 instance. That way allows us to push commits to the remote repository (GitHub) and pull them on the remote on EC2. In terms of ensuring that our computers can run GradeGator without problems and hosting GradeGator on EC2 is a matter of time. The following steps I will take are to annotate and internalize the logic of most of the files within the repository, implement S3 onto the basic react app on EC2 (by making changes to my private repository, which I still have to figure out how to do), and learn how to use a function I made using AWS Lambda. Afterwards, I will try to learn Typescript.
